Documentation: Policy synthesis via formal abstraction

Do abstraction of LTI system

Define LTI system as

$$x_{k+1} = Ax_k + Bu_k + w_k$$

$$y_k = Cx_k + Du_k + v_k$$
(1)

with

- x state of size n
- *u* input of size *m*
- A matrix of size $n \times n$
- B matrix of size $n \times m$
- y the output (used to compare accuracy)
- C output matrix of size $q \times n$
- D matrix currently assumed to be zero

$$x_{+} - \tilde{x}_{+} = (A + BK)(x - \tilde{x}) + \mathbf{r}$$
(2)

with

• \mathbf{r} in a polytope, i.e., $\mathbf{r} \in \mathcal{V}(r_i)$, the polytope generated from vertices r_i .

Consider a set defined as

$$\mathcal{R} := \{ (\tilde{x}, x) \mid (x - \tilde{x})^T M (x - \tilde{x}) \le \epsilon \}$$
(3)

Objective: Design M, K and ϵ such that if $(\tilde{x}, x) \in \mathcal{R}$ then also

$$\{(x_+ - \tilde{x}_+) | \text{ s.t. (2) } \forall \mathbf{r} \in \mathcal{V}(r_i)\} \subseteq \mathcal{R}.$$

More over for all $(\tilde{x}, x) \in \mathcal{R}$ it should hold that $d(\tilde{y}, y) \leq \epsilon$. The latter can be expressed as $C^TC \leq M$. The former can be written with matrix inequalities as

$$(x_{+} - \tilde{x}_{+})^{T} M(x_{+} - \tilde{x}_{+}) \leq \epsilon$$
$$((A + BK)(x - \tilde{x}) + \mathbf{r})^{T} M((A + BK)(x - \tilde{x}) + \mathbf{r}) \leq \epsilon$$

Hence we get something of this form

$$(x - \tilde{x})^T M(x - \tilde{x}) \le \epsilon^2 \implies ((A + BK)(x - \tilde{x}) + \mathbf{r})^T M((A + BK)(x - \tilde{x}) + \mathbf{r}) \le \epsilon^2$$

S-procedure^a

The implications

$$x^{T}F_{1}x + 2g_{1}^{T}x + h_{1} \le 0 \implies x^{T}F_{2}x + 2g_{2}^{T}x + h_{2} \le 0$$
 (4)

holds if and only if there exists $\lambda \geq 0$ such that

$$\lambda \begin{bmatrix} F_1 & g_1 \\ g_1^T & h_1 \end{bmatrix} - \begin{bmatrix} F_2 & g_2 \\ g_2^T & h_2 \end{bmatrix} \succeq 0 \tag{5}$$

Using the S-procedure we get

$$(x - \tilde{x})^T (A + BK)^T M (A + BK)(x - \tilde{x}) + 2\mathbf{r}^T M (A + BK)(x - \tilde{x}) + \mathbf{r}^T M \mathbf{r} \le \epsilon^2$$
(6)

$$\lambda \begin{bmatrix} M & 0 \\ 0 & -\epsilon^2 \end{bmatrix} - \begin{bmatrix} (A+BK)^T M (A+BK) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} - \epsilon^2 \end{bmatrix} \succeq 0$$
 (7)

$$\begin{bmatrix} \lambda M - ((A + BK)^T M (A + BK)) & -(A + BK)^T M \mathbf{r} \\ -\mathbf{r}^T M (A + BK) & (1 - \lambda)\epsilon^2 - \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$
 (8)

$$\lambda \begin{bmatrix} M & 0 \\ 0 & -\epsilon^2 \end{bmatrix} - \begin{bmatrix} (A+BK)^T M (A+BK) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} - \epsilon^2 \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M - ((A+BK)^T M (A+BK)) & -(A+BK)^T M \mathbf{r} \\ -\mathbf{r}^T M (A+BK) & (1-\lambda)\epsilon^2 - \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M (A+BK) & \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} ((A+BK)^T M (A+BK)) & (A+BK)^T M \mathbf{r} \\ \mathbf{r}^T M \mathbf{r} \end{bmatrix} \succeq 0$$

$$\begin{bmatrix} \lambda M & 0 \\ 0 & (1-\lambda)\epsilon^2 \end{bmatrix} - \begin{bmatrix} (A+BK)^T M \\ \mathbf{r}^T M \end{bmatrix} M^{-1} \begin{bmatrix} (A+BK)^T M \\ \mathbf{r}^T M \end{bmatrix}^T \succeq 0$$
 (10)

$$\begin{bmatrix} \lambda M & 0 & (A+BK)^{T}M \\ 0 & (1-\lambda)\epsilon^{2} & \mathbf{r}^{T}M \\ M(A+BK) & M\mathbf{r} & M \end{bmatrix} \succeq 0 \tag{11}$$

$$\begin{bmatrix} \lambda M^{-1} & 0 & M^{-1}(A+BK)^{T} \\ 0 & (1-\lambda)\epsilon^{2} & \mathbf{r}^{T} \\ (A+BK)M^{-1} & \mathbf{r} & M^{-1} \end{bmatrix} \succeq 0 \tag{12}$$

$$\begin{bmatrix} \lambda M^{-1} & 0 & M^{-1}(A+BK)^T \\ 0 & (1-\lambda)\epsilon^2 & \mathbf{r}^T \\ (A+BK)M^{-1} & \mathbf{r} & M^{-1} \end{bmatrix} \succeq 0$$
 (12)

(13)

Remark that this implies that $1 - \lambda \ge 0$ hence $1 \ge \lambda \ge 0$.

The objective to find a minimal ϵ can be expressed as follows

Objective:
$$\min_{M_{inv}, L} \epsilon^2$$
 (14)

$$\begin{bmatrix} \lambda M_{inv} & 0 & M_{inv}A^T + L^TB^T \\ 0 & (1-\lambda)\epsilon^2 & \mathbf{r}^T \\ AM_{inv} + BL & \mathbf{r} & M_{inv} \end{bmatrix} \succeq 0$$
 (15)

$$\begin{bmatrix} M_{inv} & M_{inv}C^T \\ CM_{inv} & I \end{bmatrix} \succeq 0 \tag{16}$$

with LM = K and $M^{-1} = M_{inv}$.
